

Ideal Customer Profiles

Aryze Product Suite

This ICP set is built around the current Aryze product suite:

1. **Pay by Bank**
2. **Stablecoin Factory**
3. **Digital Cash**

Each ICP defines the best-fit customer for one product. The purpose is to make the target customer sharper than the broader customer segment.

ICP 1: Pay by Bank

Product

Pay by Bank

Core ICP Definition

The ideal customer for Pay by Bank is a **UK merchant or payment-driven business** where incoming payments have a direct impact on margin, settlement speed, cash flow, customer experience, and day-to-day operations.

This customer is not simply looking for another checkout option. They need a better way to get paid. Their current payment setup creates enough cost, friction, delay, or operational burden that a direct bank payment rail becomes commercially attractive.

Best-Fit Company Profile

The best-fit Pay by Bank customer is a company that:

- operates in the UK
- has meaningful incoming payment volume
- depends heavily on digital payments

- experiences friction, cost, or operational issues with card-based flows
- cares about faster settlement and stronger control over incoming funds
- operates in a vertical where traditional card rails are expensive, fragile, restricted, or poorly suited
- has enough internal payment maturity to evaluate and implement a new payment rail

Strongest Current Verticals

The strongest near-term verticals are:

- gaming
- betting
- trading
- high-risk merchants
- card-under-served businesses
- merchants with elevated chargeback exposure
- businesses where top-ups, deposits, or instant funding matter commercially

Broader future-fit verticals include:

- wallets
- remittance
- e-commerce
- other payment-heavy businesses where faster settlement and better payment economics matter

Core Customer Need

Get paid faster, with less friction and more control.

This customer wants a more direct payment flow from customer bank account to merchant settlement. They want fewer operational problems, faster access to funds, and better payment economics.

Primary Buying Triggers

The customer becomes a strong-fit prospect when one or more of these problems are active:

- card costs are too high
- chargebacks create financial or operational burden
- settlement is too slow
- payment friction affects conversion or customer experience
- reconciliation creates too much manual work

- refund handling is painful
- the current payment flow is too indirect or hard to control
- the business needs instant or near-instant funding from customers

Key Pains

1. **High payment costs**
Card-based payment flows reduce margin.
2. **Slow settlement**
The business does not get access to funds quickly enough.
3. **Operational friction**
Refunds, reporting, reconciliation, and payment status tracking create avoidable work.
4. **Chargeback and dispute burden**
Fraud, chargebacks, and disputes create financial and operational drag.
5. **Lack of control**
The business does not have enough visibility or control over the full payment flow.

Desired Outcomes

The ideal customer wants:

- faster settlement
- lower payment friction
- lower payment cost
- stronger operational control
- cleaner reconciliation
- fewer chargeback-related problems
- better visibility over incoming funds
- a payment flow that scales with volume

Likely Buyer Titles

The buying committee may include:

- CFO
- Finance Director
- Treasurer
- Head of Payments
- Payments Product Manager
- VP E-commerce
- Product Lead
- Head of Fraud
- Risk Lead

- Operations Lead
- CTO
- Engineering Lead
- ERP or finance systems owner

Best-Fit Signals

A company is a strong ICP fit if:

- payments are discussed at leadership level
- card fees are visible in the payment P&L
- chargebacks or fraud are operationally relevant
- settlement speed matters to cash flow
- the company has a payment owner internally
- payment operations are already painful or strategically important
- the business is actively looking for alternatives to card rails

Poor-Fit Signals

A company is not a strong ICP fit if:

- it is not operating in the UK
- payments are low-volume or low-priority
- card costs are not a meaningful issue
- settlement speed does not matter
- the company only wants more payment-method variety
- there is no internal owner for payments
- the business cannot support payment-flow integration

Positioning Angle

Pay by Bank should be positioned to this ICP as:

A direct UK bank payment rail that helps merchants get paid faster, with lower friction and stronger operational control than traditional card-based flows.

One-Line ICP

UK payment-driven merchants, especially in gaming, betting, trading, and card-under-served verticals, where card friction, settlement delay, chargebacks, or payment costs materially affect margin and operations.

ICP 2: Stablecoin Factory

Product

Stablecoin Factory

Core ICP Definition

The ideal customer for Stablecoin Factory is a **builder, technical team, innovation team, product team, or exploratory operator** that wants to launch a simple stablecoin quickly through a self-serve, low-friction deployment flow.

This customer is not yet looking for the full institutional operating layer. They want a practical way to move from concept to live deployment without starting with a long enterprise process or a full custom infrastructure build.

Best-Fit Company Profile

The best-fit Stablecoin Factory customer is a team that:

- has a stablecoin idea or early use case
- wants to move from concept to live deployment
- values speed, experimentation, and usability
- prefers a self-serve product flow
- does not need full institutional operating depth from day one
- wants to test and learn through real usage
- has enough technical maturity to understand deployment requirements
- may later grow into deeper infrastructure needs

Strongest Customer Types

Strong-fit customers include:

- technical founders
- fintech builders
- Web3 builders
- innovation teams
- digital asset teams
- product teams

- exploratory operators
- internal venture teams
- early-stage stablecoin projects
- technical teams testing new money or asset use cases

Core Customer Need

Launch a simple stablecoin faster, with less friction.

This customer wants to avoid spending months assembling infrastructure before they can test the use case. They need a clear, usable entry point that lets them deploy, learn, and decide whether the use case deserves deeper investment.

Primary Buying Triggers

The customer becomes a strong-fit prospect when one or more of these situations apply:

- they have a stablecoin idea but no fast route to launch
- the current deployment path feels too slow or fragmented
- they want to test a use case in practice
- they want to avoid unnecessary custom build work
- they do not want a long enterprise sales or implementation process
- they need a simple entry point before committing to a full operating layer
- they want to learn from live usage rather than stay in concept mode

Key Pains

1. **The path from idea to live deployment is too heavy**
Teams can imagine the use case, but launching it takes too much work.
2. **Too much custom build work is required too early**
The customer does not want to build infrastructure from scratch before validating the idea.
3. **Stablecoin deployment feels fragmented**
There are too many components, decisions, and dependencies.
4. **Enterprise complexity comes too early**
The customer wants to start simple before taking on full institutional requirements.
5. **There is no clear starting point**
The customer needs a practical first step from concept to live setup.

Desired Outcomes

The ideal customer wants:

- faster time to live deployment
- lower deployment friction
- a self-serve product experience
- a simple issuance path
- a practical way to test and learn
- less dependence on custom engineering
- a product that can act as an entry point into deeper infrastructure later

Likely Buyer Titles

The buying group may include:

- Founder
- CTO
- VP Engineering
- Technical Lead
- Product Lead
- Head of Innovation
- Head of Digital Assets
- Platform Lead
- Principal Architect
- Builder or deployment owner

In smaller teams, the buyer and user may be the same person. In larger teams, the buyer may sit in product, innovation, digital assets, or technical leadership.

Best-Fit Signals

A team is a strong ICP fit if:

- they already have a stablecoin use case in mind
- they want to deploy quickly
- they are comfortable with self-serve tools
- they value speed over heavy customisation at the start
- they are not yet ready for a full enterprise operating model
- they want to test before committing to broader infrastructure
- they have technical capability but want to avoid unnecessary build complexity

Poor-Fit Signals

A team is not a strong ICP fit if:

- they already need a full institutional operating layer

- they require treasury, ramps, settlement, and multi-currency infrastructure from day one
- they need heavy bespoke enterprise implementation immediately
- they lack any clear stablecoin use case
- they are not technically capable of evaluating or using the product
- they expect Aryze to act as issuer or regulated operator

Positioning Angle

Stablecoin Factory should be positioned to this ICP as:

An AI-native self-serve infrastructure product that helps teams launch a simple stablecoin faster, with lower friction and without starting with full enterprise complexity.

One-Line ICP

Builders, technical teams, innovation teams, and exploratory operators with a clear stablecoin idea who need a fast, self-serve, low-friction way to move from concept to simple live deployment.

ICP 3: Digital Cash

Product

Digital Cash

Core ICP Definition

The ideal customer for Digital Cash is an **already-licensed institution** that wants to issue and operate its own digital cash programme under its own licence, governance, and control.

This customer needs more than simple issuance. They need a full operational infrastructure layer that can support settlement, ramps, treasury, multi-currency issuance, interoperability, and asset movement in real financial environments.

Best-Fit Company Profile

The best-fit Digital Cash customer is an institution that:

- is already licensed
- wants to issue under its own licence
- has a concrete institutional use case
- needs real operating infrastructure behind digital cash
- requires settlement, treasury, ramps, interoperability, or multi-currency functionality
- wants to avoid building the full stack internally
- has internal legal, compliance, treasury, risk, and technology maturity
- can support a longer enterprise buying process
- understands that Aryze provides infrastructure, while the customer remains the issuer

Strongest Customer Types

Strong-fit customers include:

- banks running tokenised deposits
- banks managing intra-bank settlement
- licensed financial institutions
- clusters of fintechs clearing between themselves
- licensed conglomerates
- institutions with treasury or settlement use cases
- financial operators that need digital cash infrastructure under their own permissions

Core Customer Need

Operate digital cash under their own licence with full institutional infrastructure behind it.

This customer wants a credible route from issuance to live operation. They need infrastructure that supports real financial activity, not just a token launch.

Primary Buying Triggers

The customer becomes a strong-fit prospect when one or more of these situations apply:

- they want to issue digital cash under their own licence
- they are exploring tokenised deposits
- they need better internal settlement
- they need better treasury or liquidity management
- they need 24/7 value movement
- they need cross-border or multi-currency capability
- they want to move beyond proof-of-concept
- they do not want to build the full operating layer internally
- they need infrastructure that can satisfy internal governance and compliance requirements

Key Pains

1. **Simple issuance is not enough**
Launching a token does not solve settlement, treasury, ramps, interoperability, or operational control.
2. **Building internally is too heavy**
A full internal infrastructure build is slow, expensive, complex, and difficult to coordinate.
3. **Governance and compliance are demanding**
Legal, risk, compliance, and management stakeholders need a credible operating model.
4. **Integration is difficult**
Digital cash must work with existing treasury systems, banking infrastructure, wallets, ledgers, and operational controls.
5. **The institution needs control without infrastructure overload**
The institution wants to remain issuer and operator, but does not want to build every component itself.

Desired Outcomes

The ideal customer wants:

- controlled issuance under its own licence
- full operational infrastructure
- settlement capability
- on and off ramps
- treasury functionality
- multi-currency issuance
- interoperability
- asset movement across environments
- lower infrastructure burden
- a credible path from issuance to live operation

Likely Buyer Titles

The buying committee will usually include:

- Head of Treasury
- Head of Transaction Banking
- Head of Payments
- Digital Assets Lead
- CFO
- COO
- CIO

- CTO
- Chief Compliance Officer
- MLRO
- General Counsel
- Risk Committee
- Executive Sponsor
- Senior Management

This is a heavy buying committee because Digital Cash touches licence scope, risk, compliance, treasury, operations, and technical infrastructure.

Best-Fit Signals

An institution is a strong ICP fit if:

- it already has the relevant licence or permissions
- it has a concrete digital cash use case
- it understands that it remains the issuer
- it needs operational depth, not just simple issuance
- it has internal urgency around settlement, treasury, liquidity, or value movement
- it has executive or strategic interest in digital cash
- it can support enterprise-level procurement and approval
- it wants infrastructure rather than a third-party issuer

Poor-Fit Signals

An institution is not a strong ICP fit if:

- it is not licensed
- it only wants simple stablecoin deployment
- it wants Aryze to become the issuer
- it has no clear use case
- it is still in pure research mode with no path to execution
- it cannot support legal, compliance, risk, or treasury review
- it needs only a lightweight test rather than full operating infrastructure

Positioning Angle

Digital Cash should be positioned to this ICP as:

Enterprise infrastructure for already-licensed institutions that want to issue and operate digital cash under their own licence, with the full operational layer required for real financial environments.

One-Line ICP

Already-licensed institutions with a concrete digital cash, settlement, treasury, or value-movement use case that need full operating infrastructure under their own licence and control.

Full ICP Summary

Pay by Bank ICP

UK payment-driven merchants, especially in gaming, betting, trading, and card-under-served verticals, where card friction, settlement delay, chargebacks, or payment costs materially affect margin and operations.

Stablecoin Factory ICP

Builders, technical teams, innovation teams, and exploratory operators with a clear stablecoin idea who need a fast, self-serve, low-friction way to move from concept to simple live deployment.

Digital Cash ICP

Already-licensed institutions with a concrete digital cash, settlement, treasury, or value-movement use case that need full operating infrastructure under their own licence and control.

Strategic ICP Priority

Priority	Product	ICP	Why It Matters
1	Pay by Bank	UK payment-driven merchants	Clearest near-term commercial pain and fastest path to revenue
2	Digital Cash	Already-licensed institutions	Strongest enterprise infrastructure opportunity

3	Stablecoin Factory	Builders and exploratory teams	High-evidence entry product for simple stablecoin deployment and future expansion
---	--------------------	--------------------------------	---

Final Position

Aryze should target three distinct ICPs:

1. **Merchants that need better payment performance**
2. **Builders that need easier stablecoin deployment**
3. **Licensed institutions that need full digital cash infrastructure**

Each ICP maps directly to one product and one core buying reason:

- **Pay by Bank:** get paid faster and with more control
- **Stablecoin Factory:** launch a simple stablecoin faster
- **Digital Cash:** operate digital cash with full institutional infrastructure
