

Value Proposition Canvas

Aryze Product Suite

This VPC set is built around the current Aryze product suite:

1. **Pay by Bank**
2. **Stablecoin Factory**
3. **Digital Cash**

Each VPC matches one customer segment with one product.

VPC 1: Pay by Bank

Customer Segment: UK Merchants and Payment-Driven Businesses

Customer Profile

Customer Segment

UK merchants and payment-driven businesses where incoming payments have a direct impact on margin, settlement speed, operational control, fraud exposure, reconciliation, and customer experience.

The strongest near-term fit is with gaming, betting, trading, high-risk merchants, card-under-served verticals, and businesses where deposits, top-ups, or instant payment flows matter commercially.

This customer does not simply want another payment option. They want a better way to get paid.

Customer Jobs

Core Job

Get paid faster, with less friction and more control.

Functional Jobs

- Receive customer payments more directly
- Reduce dependence on card-based payment flows
- Improve settlement speed
- Reduce payment friction
- Lower the operational burden of payment handling
- Improve visibility over incoming payments
- Make refunds and reconciliation easier to manage
- Reduce exposure to disputes, chargebacks, and payment uncertainty
- Support a payment setup that works reliably as volume grows

Emotional Jobs

- Feel more in control of payment operations
- Reduce frustration caused by slow, expensive, or messy payment flows
- Feel confident that funds will arrive predictably
- Avoid the stress of relying on payment rails that do not serve the business well

Social Jobs

- Be seen internally as improving payment performance
 - Help finance, operations, product, and risk teams work from a better payment setup
 - Show leadership that payments are being treated as a commercial performance lever, not just an operational cost
-

Pains

Top Pains

1. **Payment costs are too high**
The business loses too much margin in the process of getting paid.
2. **Settlement is too slow**
Funds do not arrive quickly enough to support cash flow, liquidity, or operating needs.
3. **Payment operations create too much friction**
Refunds, reporting, reconciliation, and payment status tracking create unnecessary work.

4. **Chargebacks and disputes create financial and operational drag**
Fraud, chargebacks, and failed payments increase cost, risk, and manual handling.
 5. **The payment flow is too dependent on card rails**
Traditional card-based flows can be expensive, indirect, slow, and poorly suited to some verticals.
 6. **The business lacks enough control over how money comes in**
The merchant does not have enough visibility or control over the full route from customer payment to settlement.
 7. **Some verticals are under-served by traditional payment providers**
Gaming, betting, trading, and other higher-risk categories often face more friction, higher cost, or weaker access to reliable card-based payment flows.
-

Gains

Top Desired Gains

1. Faster settlement
2. Lower payment friction
3. Lower cost of getting paid
4. Stronger operational control
5. Cleaner reconciliation
6. Better visibility over incoming funds
7. Lower burden from disputes and chargebacks
8. A more direct route from customer payment to merchant settlement
9. A payment setup that scales better as transaction volume grows

What Success Looks Like

Success means the merchant can:

- get funds faster
 - reduce friction in the payment journey
 - operate payments with more control
 - reduce dependency on expensive or fragile card flows
 - simplify payment operations
 - improve cash-flow visibility
 - support higher-volume payment activity with less operational strain
-

Value Map

Products & Services

Pay by Bank is UK account-to-account payment infrastructure for businesses that want a faster, lower-friction, and more controllable alternative to traditional card-based payment flows.

It gives merchants a direct bank-to-merchant payment rail that helps move customers from payment initiation to completed settlement more efficiently.

Pain Relievers

Pain: Payment costs are too high

Pain Reliever: Pay by Bank gives merchants a more direct account-to-account payment flow that reduces reliance on traditional card-based rails.

Pain: Settlement is too slow

Pain Reliever: Pay by Bank improves the route from customer payment to merchant settlement, helping businesses access funds faster.

Pain: Payment operations create too much friction

Pain Reliever: Pay by Bank provides a cleaner payment flow that is easier to operate, monitor, and reconcile.

Pain: Chargebacks and disputes create operational burden

Pain Reliever: Pay by Bank reduces reliance on payment models where disputes, card friction, and chargeback exposure can create avoidable drag.

Pain: The payment flow is too dependent on card rails

Pain Reliever: Pay by Bank gives merchants a direct bank payment rail that can serve use cases where card rails are expensive, fragile, or poorly suited.

Pain: The business lacks enough control over how money comes in

Pain Reliever: Pay by Bank gives the merchant stronger visibility and operational control over incoming payment flows.

Pain: High-risk or card-under-served verticals face weaker payment access

Pain Reliever: Pay by Bank gives these merchants an alternative route to customer deposits, top-ups, and bank-to-merchant payment flows.

Gain Creators

Gain: Faster settlement

Gain Creator: Pay by Bank creates a more direct route from payment initiation to completed settlement.

Gain: Lower friction

Gain Creator: Pay by Bank reduces the complexity of the payment journey by using direct bank payment infrastructure.

Gain: Better payment economics

Gain Creator: Pay by Bank gives merchants an alternative to traditional card-based cost structures.

Gain: Cleaner operations

Gain Creator: Pay by Bank supports better payment visibility, reporting, and reconciliation.

Gain: Stronger control

Gain Creator: Pay by Bank gives merchants more direct control over how funds enter the business.

Gain: Better fit for payment-heavy verticals

Gain Creator: Pay by Bank is especially relevant for merchants where card performance, chargebacks, or payment restrictions create real commercial pain.

Gain: Scalability

Gain Creator: Pay by Bank provides practical payment infrastructure that can support higher transaction volume with a more manageable operating model.

VPC Summary

Customer Wants

A faster, lower-friction, more controllable way to get paid.

Customer Jobs

Receive funds quickly, reduce payment friction, improve settlement, reduce operational burden, and gain more control over payment flows.

Customer Pains

High payment costs, slow settlement, reconciliation burden, refund friction, chargebacks, disputes, and weak control over payment flows.

Customer Gains

Faster settlement, lower friction, better economics, cleaner operations, and stronger payment control.

Value Proposition

Pay by Bank helps UK merchants and payment-driven businesses get paid faster, with lower friction and stronger operational control, by replacing higher-friction card-based flows with a more direct account-to-account payment rail.

One-Line Version

Pay by Bank gives UK merchants a faster, lower-friction, and more controllable way to get paid.

VPC 2: Stablecoin Factory

Customer Segment: Builders, Technical Teams, Innovation Teams, Product Teams, and Exploratory Operators

Customer Profile

Customer Segment

Builders, technical teams, innovation teams, product teams, technical founders, and exploratory operators that want to launch a simple stablecoin through a faster, lower-friction, self-serve deployment flow.

This customer wants a practical entry point. They want to move from idea to live setup without starting with a long enterprise process, a full custom infrastructure build, or the full complexity of institutional digital cash operations.

Customer Jobs

Core Job

Launch a simple stablecoin faster, with less friction.

Functional Jobs

- Move from stablecoin concept to live deployment
- Deploy a simple stablecoin through a self-serve flow
- Avoid long enterprise processes at the start
- Reduce custom infrastructure work
- Test a stablecoin use case in practice
- Learn through real usage
- Start simple before committing to a full institutional operating model
- Understand whether the use case deserves deeper infrastructure investment
- Create a usable deployment path without stitching together too many components

Emotional Jobs

- Feel progress instead of getting stuck in concept mode
- Reduce uncertainty around how to get started
- Avoid feeling blocked by infrastructure complexity

- Feel confident that the team can launch something real without overcommitting too early

Social Jobs

- Show internal stakeholders that the team can move from idea to execution
 - Demonstrate innovation through a live deployment rather than a theoretical plan
 - Build credibility as a team that can test new money infrastructure quickly and practically
-

Pains

Top Pains

1. **The path from idea to live deployment is too heavy**
Teams can identify a stablecoin use case, but launching it takes too much time and effort.
 2. **There is too much custom build work too early**
Teams do not want to assemble infrastructure from scratch before validating the idea.
 3. **Stablecoin deployment feels fragmented**
The process involves too many decisions, components, vendors, and technical dependencies.
 4. **Enterprise complexity appears too early**
Many teams want to start with simple issuance before taking on settlement, treasury, ramps, and full institutional operations.
 5. **There is no clear starting point**
Teams need a practical first step from concept to live setup.
 6. **Internal momentum slows down before the use case is tested**
Stablecoin projects can become stuck in planning, legal review, technical scoping, or architecture discussions before anything is deployed.
 7. **The team cannot learn without going live**
A theoretical stablecoin design does not create the same learning as a real deployed product.
-

Gains

Top Desired Gains

1. Faster path from concept to live deployment
2. Lower deployment friction
3. Self-serve setup

4. Less custom build work
5. Ability to learn through real use
6. A simple issuance path
7. A practical entry point into stablecoin deployment
8. A route that can grow into deeper infrastructure later if needed

What Success Looks Like

Success means the customer can:

- launch a simple stablecoin quickly
 - avoid unnecessary complexity at the start
 - deploy through a usable self-serve flow
 - test the use case in practice
 - learn from real usage
 - decide later whether the use case needs deeper operating infrastructure
 - move forward without a heavy enterprise process from day one
-

Value Map

Products & Services

Stablecoin Factory is an AI-native self-serve infrastructure product for launching a simple stablecoin through a low-friction deployment flow.

It is the simple deployment layer in the suite. It gives teams a faster and more accessible route from concept to live stablecoin issuance without starting with the full complexity of institutional deployment.

Pain Relievers

Pain: The path from idea to live deployment is too heavy

Pain Reliever: Stablecoin Factory gives teams a faster route from concept to simple live issuance.

Pain: There is too much custom build work too early

Pain Reliever: Stablecoin Factory reduces the need to build the initial deployment path from scratch.

Pain: Stablecoin deployment feels fragmented

Pain Reliever: Stablecoin Factory creates a clearer and more usable route into simple stablecoin deployment.

Pain: Enterprise complexity appears too early

Pain Reliever: Stablecoin Factory lets teams start with simple issuance before moving into deeper infrastructure needs.

Pain: There is no clear starting point

Pain Reliever: Stablecoin Factory acts as a practical entry point for teams that want to test and deploy.

Pain: Internal momentum slows before the use case is tested

Pain Reliever: Stablecoin Factory helps teams move from discussion to live deployment more quickly.

Pain: The team cannot learn without going live

Pain Reliever: Stablecoin Factory enables real usage, allowing teams to learn from deployment rather than theory.

Gain Creators

Gain: Faster deployment

Gain Creator: Stablecoin Factory shortens the path from concept to live setup.

Gain: Lower friction

Gain Creator: Stablecoin Factory provides a self-serve deployment experience.

Gain: Less custom build work

Gain Creator: Stablecoin Factory gives teams a ready infrastructure route for simple issuance.

Gain: Real-world learning

Gain Creator: Stablecoin Factory enables customers to test and learn through actual deployment.

Gain: Simple entry point

Gain Creator: Stablecoin Factory gives teams a practical way to start before committing to enterprise infrastructure.

Gain: Expandability

Gain Creator: Stablecoin Factory can serve as the first step before a more mature use case moves toward deeper infrastructure needs.

Gain: Better execution speed

Gain Creator: Stablecoin Factory helps teams turn stablecoin interest into action faster.

VPC Summary

Customer Wants

A fast, simple, low-friction way to launch a stablecoin.

Customer Jobs

Move from concept to live deployment, test a use case, avoid heavy custom build work, and learn through real usage.

Customer Pains

Heavy deployment path, too much custom work, fragmented infrastructure, early enterprise complexity, and no clear starting point.

Customer Gains

Fast deployment, self-serve setup, lower friction, practical learning, and a simple entry point that can grow later.

Value Proposition

Stablecoin Factory helps builders, technical teams, innovation teams, product teams, and exploratory operators launch a simple stablecoin faster through an AI-native, self-serve deployment flow that reduces friction and avoids full enterprise complexity at the start.

One-Line Version

Stablecoin Factory gives teams a fast, self-serve, low-friction way to launch a simple stablecoin.

VPC 3: Digital Cash

Customer Segment: Already-Licensed Institutions Operating Digital Money

Customer Profile

Customer Segment

Already-licensed institutions that want to issue and operate their own digital cash programme under their own licence, governance, and control.

This includes banks running tokenised deposits, banks managing intra-bank settlement, clusters of fintechs clearing between themselves, conglomerates with their own licences, and other licensed financial institutions with real digital cash operating needs.

This customer needs more than simple issuance. They need a full operational infrastructure layer that can support digital cash in real financial environments.

Customer Jobs

Core Job

Operate digital cash under their own licence with full institutional infrastructure behind it.

Functional Jobs

- Issue digital cash under the institution's own licence
- Operate a real digital cash programme
- Support settlement
- Support on and off ramps
- Manage treasury functionality
- Support multi-currency issuance
- Move assets across environments
- Integrate digital cash with existing financial infrastructure
- Maintain governance, compliance, and operational control
- Avoid building the full infrastructure stack internally
- Move from concept or pilot into live operation

Emotional Jobs

- Feel confident that the model is credible enough for internal approval
- Reduce uncertainty around digital cash operations
- Avoid the risk of launching something that only works technically but not operationally
- Feel in control of a strategically important financial infrastructure project

Social Jobs

- Be seen as a serious and responsible institution moving into digital money
- Show internal leadership on tokenised finance and digital cash
- Build confidence across treasury, risk, legal, compliance, operations, and technology teams
- Demonstrate that the institution can innovate without compromising governance or control

Pains

Top Pains

1. **Simple issuance is not enough**
Launching a token does not solve settlement, ramps, treasury, interoperability, or operational control.
2. **Building the full stack internally is too heavy**
Internal development is slow, expensive, complex, and difficult to coordinate across functions.
3. **Governance and compliance requirements are demanding**
Legal, risk, compliance, and management stakeholders need a credible operating model.

4. **Integration with existing financial infrastructure is difficult**
Digital cash must work with treasury systems, banking infrastructure, wallets, ledgers, reporting, and operational controls.
 5. **The institution needs control without infrastructure overload**
The customer wants to remain issuer and operator, but does not want to build every component itself.
 6. **Moving from concept to live operation is hard**
Many institutions can explore digital cash, but real deployment requires operational depth.
 7. **Cross-environment value movement is complex**
Moving value across currencies, assets, ledgers, fiat rails, and institutional systems creates technical and operational difficulty.
-

Gains

Top Desired Gains

1. Controlled issuance under the institution's own licence
2. Full operational infrastructure behind digital cash
3. Stronger settlement capability
4. On and off ramp functionality
5. Treasury functionality
6. Multi-currency issuance
7. Interoperability and asset movement
8. Lower infrastructure burden
9. A credible route from issuance to live operation
10. Stronger institutional control

What Success Looks Like

Success means the institution can:

- issue digital cash under its own licence
 - operate the programme with confidence
 - support settlement and treasury needs
 - move assets across environments
 - connect digital cash to real financial operations
 - maintain governance and control
 - avoid unnecessary internal build burden
 - move beyond proof-of-concept into live usage
-

Value Map

Products & Services

Digital Cash is enterprise infrastructure for already-licensed institutions that want to issue and operate their own digital cash programme through a full operational model.

It provides the infrastructure layer behind institution-run digital cash, including settlement, ramps, multi-currency issuance, treasury functionality, interoperability, and asset movement across real financial environments.

Pain Relievers

Pain: Simple issuance is not enough

Pain Reliever: Digital Cash provides the full operational layer behind issuance, including settlement, ramps, treasury, multi-currency issuance, interoperability, and asset movement.

Pain: Building the full stack internally is too heavy

Pain Reliever: Digital Cash reduces the need for the institution to build every infrastructure component itself.

Pain: Governance and compliance requirements are demanding

Pain Reliever: Digital Cash is designed for already-licensed institutions that need infrastructure to operate under their own licence, governance, and control.

Pain: Integration with existing financial infrastructure is difficult

Pain Reliever: Digital Cash supports digital cash as infrastructure for real financial environments, not as an isolated token launch.

Pain: The institution needs control without infrastructure overload

Pain Reliever: Digital Cash lets the institution remain the issuer while Aryze provides the infrastructure layer behind the programme.

Pain: Moving from concept to live operation is hard

Pain Reliever: Digital Cash gives the institution a clearer path from issuance to real operation.

Pain: Cross-environment value movement is complex

Pain Reliever: Digital Cash supports asset movement, interoperability, ramps, treasury, and multi-currency issuance across environments.

Gain Creators

Gain: Controlled issuance

Gain Creator: Digital Cash allows the customer to issue under its own licence and governance.

Gain: Full operational infrastructure

Gain Creator: Digital Cash provides the operating layer needed to run digital cash in practice.

Gain: Better settlement

Gain Creator: Digital Cash includes settlement capability as part of the infrastructure layer.

Gain: Ramps

Gain Creator: Digital Cash supports on and off ramp capability as part of the operating model.

Gain: Treasury functionality

Gain Creator: Digital Cash supports treasury needs for institutions operating digital cash.

Gain: Multi-currency issuance

Gain Creator: Digital Cash enables institutions to support multiple currencies or stable references.

Gain: Interoperability

Gain Creator: Digital Cash supports movement across financial and asset environments.

Gain: Lower infrastructure burden

Gain Creator: Digital Cash reduces the need for a full internal build.

Gain: Real deployment readiness

Gain Creator: Digital Cash helps customers move from token concept to live institutional operation.

Gain: Stronger institutional credibility

Gain Creator: Digital Cash gives institutions a more serious and operationally complete route into digital money.

VPC Summary

Customer Wants

A controlled, institution-ready way to issue and operate digital cash under their own licence.

Customer Jobs

Issue digital cash, operate it in real financial environments, support settlement, ramps, treasury, multi-currency issuance, interoperability, and maintain governance and control.

Customer Pains

Simple issuance is not enough, internal builds are too heavy, compliance is demanding, integration is difficult, and real operation requires more infrastructure depth.

Customer Gains

Controlled issuance, full operating infrastructure, stronger settlement, treasury, ramps, interoperability, lower build burden, and live deployment readiness.

Value Proposition

Digital Cash helps already-licensed institutions issue and operate their own digital cash programme through a full enterprise infrastructure layer that supports settlement, ramps, treasury, multi-currency issuance, interoperability, and asset movement under the customer's own licence and control.

One-Line Version

Digital Cash gives already-licensed institutions the full infrastructure layer to issue and operate digital cash under their own licence and control.

Full VPC Summary

Pay by Bank

Customer: UK merchants and payment-driven businesses

Need: Get paid faster, with less friction and more control

Product: Direct UK account-to-account payment infrastructure

Value: Faster settlement, lower friction, stronger operational control

Stablecoin Factory

Customer: Builders, technical teams, innovation teams, product teams, and exploratory operators

Need: Launch a simple stablecoin faster and with less friction

Product: AI-native self-serve stablecoin deployment infrastructure

Value: Faster path from concept to live issuance

Digital Cash

Customer: Already-licensed institutions operating digital money

Need: Issue and operate digital cash with full institutional infrastructure

Product: Enterprise digital cash infrastructure

Value: Settlement, ramps, treasury, multi-currency issuance, interoperability, and asset movement under the customer's own licence

Final Strategic VPC Conclusion

Aryze's current product suite has three clear customer-product fits.

Pay by Bank fits UK merchants that need better payment performance.

Stablecoin Factory fits builders and exploratory teams that need a faster way to launch a simple stablecoin.

Digital Cash fits already-licensed institutions that need full infrastructure to operate digital cash in real financial environments.

The suite is strongest when each product is positioned against its specific customer job:

- **Pay by Bank:** get paid better
- **Stablecoin Factory:** launch faster
- **Digital Cash:** operate digital cash properly
